Ten extensions

From agency plans to a government-wide program

Status: Draft v0.1 (2026-11-04), for Steve's review. Builds on the working plan, the review plan, the roadmap, the all-agency plan and the forensic methods handbook.

Bottom line

The agency plans say where fraud is likely and which public-data screens to run first. These ten extensions supply what a leader asks next: how the screens work across agencies, what they would return, what a first engagement looks like, what the law allows, and whether the controls will survive contact with people trying to beat them. Each has a planning document; seven have tested reference code; the ROI model and live demo also have pages on the site.

#	Extension	Document	Code	Site
1	Cross-agency data matching	Cross-agency matching	`analytics/forensic/crossmatch.py`	Library
2	Network and graph analytics	Network analytics	`analytics/forensic/network.py` (cluster scoring)	Library
3	Recovery and ROI model	ROI model	`analytics/roi/`	Library, ROI calculator
4	Pilot proposal kit	Pilot kit	—	Library
5	Policy and legal track	Policy and legal track	—	Library
6	Procurement and contract fraud	Procurement fraud	`analytics/forensic/procurement.py`	Library
7	Grants to states	Grants to states	`analytics/forensic/passthrough.py`	Library
8	Live demo on public data	Live demo	`analytics/demo/`	Live demo page
9	Whistleblower and tip triage	Tip triage	`analytics/triage/tips.py`	Library
10	Red-team playbook	Red-team playbook	—	Library

How they fit together

- **Engine:** cross-agency matching (1) builds the linked identities; network analytics (2) groups them into rings; procurement (6) and grants to states (7) are new screen families on top of the

same spine.

- **Case for action:** the ROI model (3) gives each program a business case and a break-even bar; the live demo (8) shows the methods running on real data instead of wireframes.
- **Engagement:** the pilot kit (4) is the 90-day offer; the policy and legal track (5) is the map for data access; tip triage (9) is a second, small offer that any OIG can accept quickly.
- **Durability:** the red-team playbook (10) answers "won't they just adapt?" before anyone asks.

What changed in the plan

1. **Shared screens get priority over single-agency builds for small programs.** The ROI model shows OPM retirement, FEMA Public Assistance and closed pandemic programs do not pay back on their own; they should ride on cross-agency matching and exclusion checks.
2. **The first Phase 2 proposal is the HHS 90-day pilot**, with SBA as the alternate, using the pilot kit's stop rule and metrics.
3. **Every proposal carries the ROI row, the break-even rate and the legal route** from the policy track.
4. **Tip triage is offered as a quick, low-data second engagement** with the same OIGs.

Decisions for Steve

1. HHS-OIG or SBA OIG as the first pilot partner?
2. Publish the policy white paper on Do Not Pay data access now, or wait for the first pilot result?
3. Which award datasets should the live demo pull next (VA, DoD or GSA contracts)?
